

Internet security

Many children as well as adults spend half of their day surfing the Internet.

However, as good as the internet is, it has its downsides. Like internet bullying, hackers, likes/hate comments, and many other things that can ruin a person's day. Because we all know we use the internet, we also need to know how to protect ourselves from it and surf safely. I have researched some rules and preventions to protect us against the bad side of the internet. I will share them with you now 😊

- **For example**, we can block "hate" pages, they can make us sad by writing badly about us in our posts. Therefore, it is best to block them.

- **We all know that** all people on this planet can be found on the Internet. However, the bad thing is that sometimes they present themselves with false information, just to get in touch with us. So one of the most important rules on the Internet is not to talk to a stranger who sent us a message. If you are not sure who it is, consult your parents so that it is not a relative, drinker or acquaintance. If they do not know immediately click on the block and block it.

- **Do not click on all options**. You know when you go to a site and it says "yes" or "I accept". If you are not sure what to "accept", consult someone who understands. That one push can bring you big problems.

- **If you want to download** an application from an Internet site, use legal sites. Not every site is safe, that is, it can bring a virus to your computer. But it would also be bad to download applications in a pirated way. So, use legal, recommended sites.

- **Never send pictures** to people you have met online. They may pretend to be good and confident, but the truth is different. They can publish them publicly and embarrass or manipulate you. Therefore, do not do bad things to yourself, do not send pictures to people you have not met live ...
